

8051 Adc Block Diagram

Pin Diagram of 8051 Microcontroller with Explanation: A microcontroller is a small and low-cost microcomputer which is basically designed to perform some specific tasks of an embedded system like receiving remote signals or displaying microwave information etc. A microcontroller consists of a processor, a fixed amount of memory (RAM, ROM, EPROM), serial ports and some peripheral devices like ...

The architecture of the 8051 microcontroller can be understood from the block diagram. It has Harward architecture with RISC (Reduced Instruction Set Computer) concept. The block diagram of 8051 microcontroller is shown. It consists of: an 8-bit ALU; one 8-bit PSW (Program Status Register) A and B registers; one 16-bit Program counter

The 8051 ROM is a non-volatile memory meaning that its contents cannot be altered and hence has a similar range of data and program memory, i.e, they can address program memory as well as a 64K separate block of data memory. RAM The 8051 microcontroller is composed of 128 bytes of internal RAM.

How to Interface LM35 With the 8051? The Only method to interface the LM35 with the 8051 microcontroller is by using the internal ADC of 8051. With this method we can read the analogue

Cell phones operate on the digital voice signal. Originally the voice is in analog form, which is converted through ADC before feeding to the cell phone transmitter. Images and videos captured using camera is stored in any digital device, is also converted into digital form using ADC.; Medical Imaging like x-ray & MRI also uses ADC to convert images into Digital form before modification.
